                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hybrid surface proteins are claimed in which an active polypeptide (e.g. a surface antigen from a mammalian tumnour cell, sperm or an allergen, bacterium, virus, parasite or fungus) is fused to an anchor region from a surface antigen normally expressed on the cell surface of gram positive bacteria. The anchor segment is pref. derived from a streptococcal M protein (see AAR41780). Sequence AAR41783 is a peptide sequence from the cs protein of p. falciparum (Nature 314.111-114) suitable for development of a vaccine against malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels
The sequence NANP can be repeated 3-40 times. When conjugated to a tuberculin protein derivative, the product is useful as an anti-malaria vaccine and provides a high antibody response.
                                                                                                  Indels

Synthetic peptide antigen analogues of native peptide antigens which are either (1) retro modified, (2) inverso modified or (3) retronances modified with respect to the native antigen can be used to raise antibodies which recognise the native antigen and hence can be used in the treatment and/or prophylaxis of diseases and therapy of disease states. They can be used in the production of vaccines and in assays for antibodies specific for the native antigen. They can have increased stability to degredation after administration and they can immunodominant epitope of the circumsporcozoite coat protein of plasmodium falciparum. The retro-inverso versionof this sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The malaria circumsporozoite protein repeat region is used in an immunogenic composition along with the T-cell epitope derived from malaria. The T-cell epitope elicits an anti-malarial T-cell response in mammals of diverse genetic backgrounds. The composition can be used as a vaccine to confer prophylactic or therapeutic immunity against malaria. They may also be used to inhibit the propagation of a malarial organism in a susceptible animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a peptide comprising a malarial B-cell epitope, which is contained in the COOH-terminal repeat region of the Plasmodium falciparum circumsporzoite (CS) protein. It is this epitope that stimulates the production of antibodies that specifically recognise and bind to the malarial CS protein. This epitope can be incorporated into a polyoxime with T-cell epitopes to produce a vacche that is packgrounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic composition containing T cell epitope of malaria-derived peptide - incorporated into a poly:oxime and optionally B cell epitope, used in vaccines to protect against malaria in subjects of differing genetic background(s)
                                           New immunogenic compositions for malaria – comprise malaria derived peptide comprising universal T-cell epitope which elicits anti-malarial T-cell response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Circumsporozoite protein; CS; antibody; polyoxime; T-cell epitope;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T-cell; malaria; immunogenic; anti-malarial; prophylactic immunity.
                                                                                                                                                                                                                                                                                                                                                                       The protein represents 12 amino acid units of the P. falciparum circumsporozoite protein repeat region (AAR70034), which are sufficient for the production of antibodies reactive against the whole protein. Insertion of the coding sequence into the major coat protein gene VIII of bacteriophage Fd in a region of the protein known to be exposed on the virus surface results in expression of the P. falciparum antigen on the phage surface. Thus, the phage is useful in a vaccine composition against malarla, or as a therapeutic/diagnostic product.
                                                                                                                                                                                                                                                                                    Filamentous bacteriophage engineered to display T- and B-cell epitopes and/or a peptide eliciting HIV neutralising antibodies - useful in vaccines and as a therapeutic/diagnostic prod.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a hybrid protein (H1) comprising at least a portion of a particle forming protein and one or more polypeptides having at least one epitope of interest such as an epitopic site of a pathogen or toxin. Also describes is a method of the interest of pathogen or toxin. Also describes is a method of the interest of pathogen or toxin. Also describes of interest of for inducing an immune response to one or more epitopes of interest of patholic site is immunologically reactive. The patholic site is immunologically reactive. The particles can be used as vaccines or for the production of antibodies of the proposition in vitro diagnostics. Which can be used for passive immunisation, in vitro diagnostics, which can be used for passive immunisation. The particles can also be expected on a says for detecting the presence of antibodies to the antigen of interest. The present sequence represents a peptide used in the complification of the present invention.

The present invention describes a conjugate (A) comprising a catrategically modified hepatitis B core (HBC) protein (I) attached to a trategically modified hepatitis B core (HBC) protein (I) attached to a hapten, where (I) includes amino acids (aas 10-140 of the wild type (II) in the 183 as sequence (given in ANZ29674) and additionally has an insert (II) in the region corresponding to aa's 50-100, where the insert is corresponding to a protective antibody response against corporations from which the hapten is derived, in humans or other corporation of (II) correcomes the low reactivity of aa side chains in native HBC protein, increasing the reactivity with hapten corporating in conjugates of improved immunogenicity. Modified HBC can be derivatised in the form of particles by well-defined chemical corporations and is unlikely to cause immunological side-effects. ANX29675
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conjugate of hepatitis B core protein, modified to increase reactivity with hapten, used to raise antibodies against the hapten, e.g. in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hepatitis, tuberculosis). The activated T-cells can be used to treat the same conditions by adoptive T-cell transfer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                Peptides AAW67583-W67611 are used to produce activated T helper (CD4+) and cytotoxic (CD8+) T-cells. The activated T cells are produced by treating peripheral blood lymphocytes with liposome-enospaulated peptide antigen to generate Ag-loaded antigen-presenting cells (APC), contacting naive or anergic T-cells with these APC, and isolating the resulting partivalarly one derived from a temour, but also those from viruses, bacteria and other parasites. It can also be used to identify antigens and epitopes able to generate an Ag-specific T-cell response (by assessing proliferation and cytokine release). Also the Ag-loaded APC can be used as cellular vaccines for treating cancer (claimed) or other diseases (e.g. malaria, human immune deficiency virus infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                Method of activation of T cells - by exposure to antigen-presenting cells loaded with antigen in liposome, used for, e.g. treating

It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apital membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting

                                                                                                                                                                                                                                                                                             The invention relates to the use of the anion exchange resin DEAE-sephadex A50 as a solid support for solid phase peptide synthesis and affinity chromatography. The present sequence represents a repetitive plasmodium falciparum circumsporozoite peptide epitope which was used to raise monochonal antibodies. The affinity between the antibodies and free recombinant antigen was determined via competition affinity chromatography using a DEAE-Sephadex A50 column comprising a resin-bound form of the peptide epitope (AAB73754).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                       Use of an anion exchange resin (EPM-7) as solid support for peptide, e.g. angiotensin II, synthesis and affinity chromatography .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amino acid sequence of MAL1, which is displayed on E2 core surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E2 core protein; 2-oxo acid dehydrogenase; multienzyme complex;

                                                                                                                 The specification describes a truncated E2 core protein of a 2-oxo acid dehydrogenase multienzyme complex, where the protein assembles into a core structure of the complex. The E2 core protein has an ability to display a variety of different numbers of peptides or polypeptides on a single complex, and the ability to display a variety of different peptides or polypeptides on the same complex. The E2 core protein is perides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides or polypeptides, and for the elicitation of immune responses, e.g. for vaccination. It is also useful for obtaining and/or raising antibodies to the peptides or polypeptides, for evoking an immune response, and in pharmaceutical compositions. The present sequence response, and in pharmaceutical compositions. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a novel method of immunisation involving

0
the administration of a haematopoietic cell specific expression element to a lymphoid cell. The method is known as somatic transgene immunisation. It is particularly useful in the treatment and prevention of tunours, autofimmune diseases, allergy, metabolic disorders, endocrine disorders, pain, blood disorders and dental disorders.
                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patentors claim a novel conjugate which comprises AAP60804 and a carier protein. The conjugates are useful for providing protective immunity against malaria. The conjugates are effective in raising high titres of antibodies in vivo. These antibodies recognise sporozoites and neutralise sporozoite infectivity in vitro by a vigorous CSP reaction. The epitope of the P.falciparum CS protein is

Synthetic peptide antigen analogues of native peptide antigens which are either (1) retro modified, (2) inverso modified or (3) retro-inverso modified with respect to the native antigen can be used to raise antibodies which recognise the native antigen and hence can be used in the treatment and/or prophylaxis of diseases and therapy of disease states. They can be used in the production of vaccines and in assays for antibodies specific for the native antigen. They can have increased stability to degredation after administration and they can be administrated orally. This sequence is based on the immunodominant epitope of the circumsporcozoite coat protein of plasmodium falciparum. The retro-inverso version of this peptide

Sequence 105, Application US/09248588
Sequence 105, Application US/09248588
Patent No. 6231864
APPLICANT: BIrkett, Ashley J.
TITLE OF INVENTION: Strategically Modified Hepatitis B Core Proteins and TITLE OF INVENTION: their Derivatives
TITLE OF INVENTION: their Derivatives
FILE REPERENCE: SYN-101 4564/69529
CURRENT APPLICATION NUMBER: US/09/248,588
CURRENT FILING DATE: 1999-02-11
SARLIER RPLING DATE: 1999-02-12
NUMBER OF SEQ ID NOS: 113
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 105
LENGTH: 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   OTHER INFORMATION: Description of Artificial Sequence: Cytochrome OTHER INFORMATION: P-450 fragment PUBLICATION INFORMATION: JOURNAL: Science

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MOIL BIOCHEM. PARASITOI. 22:101-108(1987).

-!- FUNCTION: THE CIRCUMSPOROZOITE PROTEIN IS THE IMMUNODOMINANT
SURFACE ANTIGEN ON THE SPOROZOITE (THE INFECTIVE STAGE OF THE
MALARIA PARASITE THAT IS TRANSMITTED FROM THE MOSQUITO TO THE
VERTEBRATE HOST).

-!- MISCELLANBOUS: THE C-TERMINAL REGION IS PROBABLY USED FOR
ANCHORING THE PROTEIN TO THE CELL MEMBRANE. THE REPEAT SEQUENCES
WOULD BE THE SURFACE ANTIGEN OF THE ORGANISM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                [1]

Isolation of mitochondrial cyclophilin from bovine heart.";
Blochem. Blophys. Res. Commun. 190:857-863(1993).
-!- FUNCTION: PETAESE ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PETILE BONDS IN OLIGOPEPTIDES.
-!- SUBCELLULAR LOCATION: MITOCHONDRIAL MATRIX.
-!- SIMILARIY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.

```

```
The protein was produced by expression of a synthetic gene. The analogue comprises AAs 68-123 of the native P. falciparum CS protein, followed by four repeat sequences (three "B"s, i.e. NANP) and one "A", i.e. NVDP), followed by AAs 289-392 of the native protein. Reduction of the immunological dominance of the repeats relative to the epitopes in the regions flanking the repeats enhances sporozoite neutralising activity.
sequence to a 2nd (C-terminal) sequence comprising tetrapeptide units of CSP. See AAP82542.

                                                                                                                                                    The present sequence is the antigenic epitope P592, derived from circumsporozoite protein (CSP) of the sporozoite stage of plasmodium fallogrum. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, Trecal epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-1 (MSP-1), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), Liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), Liver stage antigen-1 (AMA-1), erythrocyte binding antigen-175 (BBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27 These epitopes were obtained at different stages of the circumstant and explese of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                            Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the N-terminal of an immunogenic polypeptide useful as a malaria vaccine. It comprises a fragment of the P-falciparum cicumsporozoite protein (CSP) and one copy of a peptide linker, which is pref. present in 3-10 copies, which links the preceding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunogenic polypeptide for malaria vaccine - contg.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The protein was produced by expression of a synthetic gene. The analogue comprises AAs 43-123 of the native P. falciparum CS protein, followed by four repeat sequences (three "B"s", i.e. NANP) and one "A", i.e. NVDP), followed by AAS 289-374 of the native protein. Reduction of the immunological dominance of the repeats relative to the epitopes in the regions flanking the repeats enhances sporozoite neutralising activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein (Dame et al., Science 225: 593 (1984)). and the influenca virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region less the first nine N-terminal AAs. This CS fusion is designated RLfGelta9. The Pro residue separating the ASP (at the C-terminal of the linker) from RLfGelta9 is an artifact of a filled in BamHI site. The peptide can be used in a vaccine for protection against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptide comprising immunogenic determinants from P falciparum for vaccine against malaria infection in humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984), and the influenza virus non-structural science 10.53 (1984), and the influenza virus non-structural protein [NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region.

I contg. flanking regionless the 18 AA signal region. The Pro residue separating the ASP (at the C-terminal of the linker) from Rifauth is an artifact of a filled in Bamili site; the Gly separating Region I and CR Region II-contg. CS flanking regions is an artifact of a synthetic PokI/TthIII I linker. The peptide can be used in a vaccine for protection against malaria.
